

Pharmacotherapy of Asthma: Part 2

February 1, 2021

Christine A. Sorkness, Pharm.D.
Professor of Pharmacy and Medicine (CHS)
UW School of Pharmacy

Start ICS-Containing Rx for Adults & Adolescents - GINA 2020

- As soon as possible, after the diagnosis of asthma is made to improve treatment and to reduce risk
 - Patients with even mild asthma can have severe exacerbations
 - Low dose ICS → ↓ hospitalizations & death
 - Low dose ICS → ↓ severe exacs, ↓ Sx, ↑ PFTs, ↓ EIB, even in mild asthma
 - Low dose ICS → ↑ PFTs than if Sx have been present for > 2-4 years
 - Patients not taking ICS who have a severe exac, have ↓ long-term lung function than those who have started ICS
 - In occupational asthma, early removal from exposure & early Rx increase chance of recovery
- Most patients with asthma do not need more than low dose ICS

SUGGESTED INITIAL CONTROLLER TREATMENT IN ADULTS AND ADOLESCENTS WITH A DIAGNOSIS OF ASTHMA

FIRST ASSESS:

- Confirmation of diagnosis

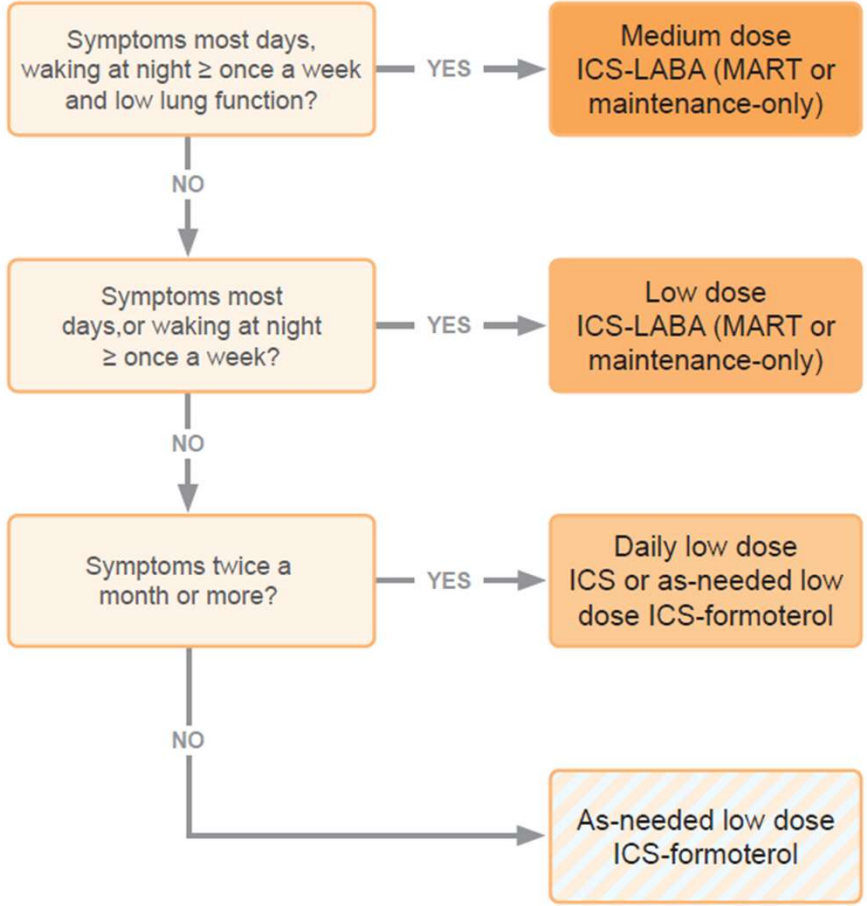

- Symptom control & modifiable risk factors (including lung function)

- Comorbidities

- Inhaler technique & adherence

- Patient preferences & goals

IF:

START WITH:

STEP 4

STEP 3

STEP 2

STEP 1

Short course OCS may also be needed for patients presenting with severely uncontrolled asthma

NAEPP Expert Panel

2020 Focused Asthma Updates

- 6 priority topics for priority review, including intermittent ICSs and role of LAMAs
- Cromolyn, nedocromil, LTRAs, and theophylline were not included, due to less desirability
 - Limited availability *and/or*
 - Increased risk of adverse events *and/or*
 - Need for monitoring

AGES 12+ YEARS: STEPWISE APPROACH FOR MANAGEMENT OF ASTHMA

	Intermittent Asthma	Management of Persistent Asthma in Individuals Ages 12+ Years				
Treatment	STEP 1	STEP 2	STEP 3	STEP 4	STEP 5	STEP 6 [■]
Preferred	PRN SABA	Daily low-dose ICS and PRN SABA or PRN concomitant ICS and SABA▲	Daily and PRN combination low-dose ICS-formoterol▲	Daily and PRN combination medium-dose ICS-formoterol▲	Daily medium-high dose ICS-LABA + LAMA and PRN SABA▲	Daily high-dose ICS-LABA + oral systemic corticosteroids + PRN SABA
Alternative		Daily LTRA* and PRN SABA or Cromolyn,* or Nedocromil,* or Zileuton,* or Theophylline,* and PRN SABA	Daily medium-dose ICS and PRN SABA or Daily low-dose ICS-LABA, or daily low-dose ICS + LAMA,▲ or daily low-dose ICS + LTRA,* and PRN SABA or Daily low-dose ICS + Theophylline* or Zileuton,* and PRN SABA	Daily medium-dose ICS-LABA or daily medium-dose ICS + LAMA, and PRN SABA▲ or Daily medium-dose ICS + LTRA,* or daily medium-dose ICS + Theophylline,* or daily medium-dose ICS + Zileuton,* and PRN SABA	Daily medium-high dose ICS-LABA or daily high-dose ICS + LTRA,* and PRN SABA	
		Steps 2-4: Conditionally recommend the use of subcutaneous immunotherapy as an adjunct treatment to standard pharmacotherapy in individuals ≥ 5 years of age whose asthma is controlled at the initiation, build up, and maintenance phases of immunotherapy▲			Consider adding Asthma Biologics (e.g., anti-IgE, anti-IL5, anti-IL5R, anti-IL4/IL13)**	

Assess Control

- First check adherence, inhaler technique, environmental factors,▲ and comorbid conditions.
- **Step up** if needed; reassess in 2-6 weeks
- **Step down** if possible (if asthma is well controlled for at least 3 consecutive months)

Consult with asthma specialist if Step 4 or higher is required. Consider consultation at Step 3.

Control assessment is a key element of asthma care. This involves both impairment and risk. Use of objective measures, self-reported control, and health care utilization are complementary and should be employed on an ongoing basis, depending on the individual's clinical situation.

NOTES FOR INDIVIDUALS AGES 12+ YEARS DIAGRAM

Quick-relief medications	<ul style="list-style-type: none">• Use SABA as needed for symptoms. The intensity of treatment depends on the severity of symptoms: up to 3 treatments at 20-minute intervals as needed.• In steps 3 and 4, the preferred option includes the use of ICS-formoterol 1 to 2 puffs as needed up to a maximum total daily maintenance and rescue dose of 12 puffs (54 mcg).▲• Caution: Increasing use of SABA or use >2 days a week for symptom relief (not prevention of EIB) generally indicates inadequate control and may require a step up in treatment.
Each step: Assess environmental factors, provide patient education, and manage comorbidities ▲	<ul style="list-style-type: none">• In individuals with sensitization (or symptoms) related to exposure to pests: conditionally recommend integrated pest management as a single or multicomponent allergen-specific mitigation intervention.▲• In individuals with sensitization (or symptoms) related to exposure to identified indoor allergens, conditionally recommend a multi-component allergen-specific mitigation strategy.▲• In individuals with sensitization (or symptoms) related to exposure to dust mites, conditionally recommend impermeable pillow/mattress covers only as part of a multicomponent allergen-specific mitigation intervention, but not as a single component intervention.▲
Notes	<ul style="list-style-type: none">• The terms ICS-LABA and ICS-formoterol indicate combination therapy with both an ICS and a LABA, usually and preferably in a single inhaler.• Where formoterol is specified in the steps, it is because the evidence is based on studies specific to formoterol.• In individuals ages 12 years and older with persistent allergic asthma in which there is uncertainty in choosing, monitoring, or adjusting anti-inflammatory therapies based on history, clinical findings, and spirometry, FeNO measurement is conditionally recommended as part of an ongoing asthma monitoring and management strategy that includes frequent assessment.• Bronchial thermoplasty was evaluated in Step 6. The outcome was a conditional recommendation against the therapy.

GINA 2020

Box 3-5A

Adults & adolescents 12+ years

Personalized asthma management:

Assess, Adjust, Review response

'Controller' treatment means the treatment taken to prevent exacerbations

Asthma medication options:

Adjust treatment up and down for individual patient needs

PREFERRED CONTROLLER

to prevent exacerbations and control symptoms

Other controller options

PREFERRED RELIEVER

Other reliever option

Symptoms
Exacerbations
Side-effects
Lung function
Patient satisfaction

Confirmation of diagnosis if necessary
Symptom control & modifiable risk factors (including lung function)
Comorbidities
Inhaler technique & adherence
Patient goals

Treatment of modifiable risk factors & comorbidities
Non-pharmacological strategies
Education & skills training
Asthma medications

* Off-label; data only with budesonide-formoterol (bud-form)

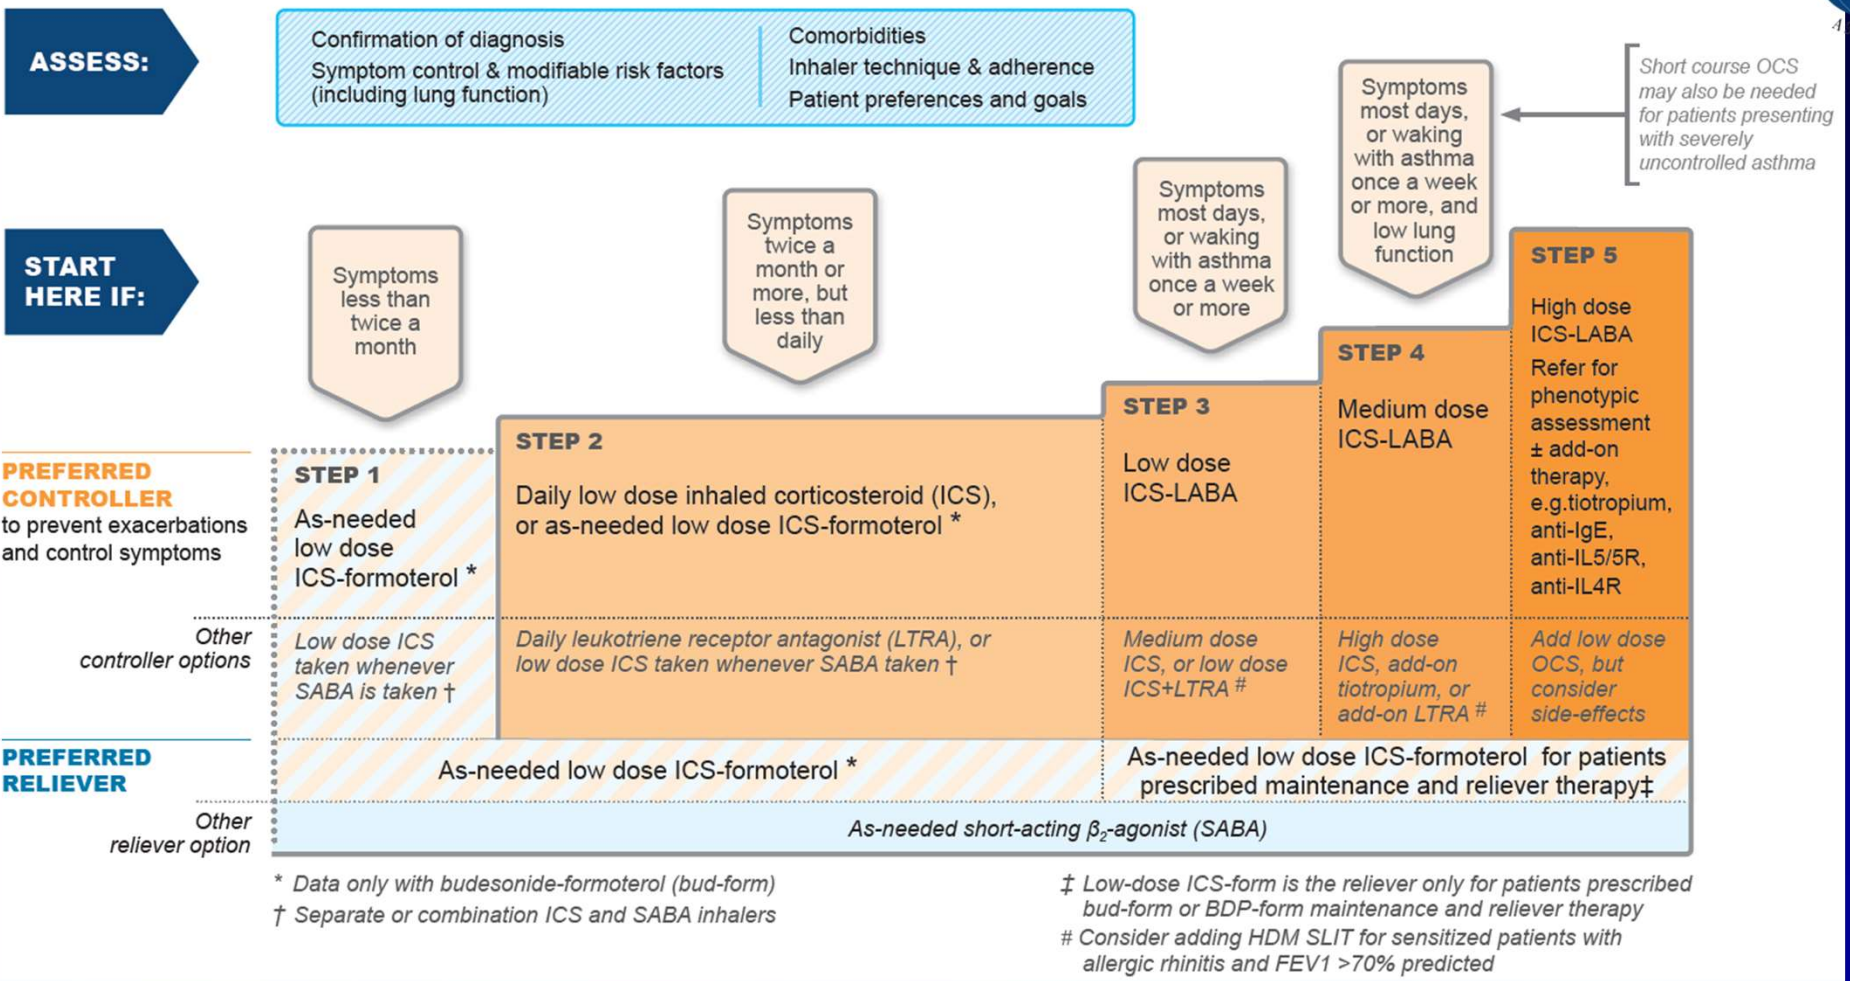

† Off-label; separate or combination ICS and SABA inhalers

‡ Low-dose ICS-form is the reliever for patients prescribed bud-form or BDP-form maintenance and reliever therapy

Consider adding HDM SLIT for sensitized patients with allergic rhinitis and FEV₁ >70% predicted

*Step 2 – Daily LTRA

SUGGESTED INITIAL CONTROLLER TREATMENT IN ADULTS AND ADOLESCENTS WITH A DIAGNOSIS OF ASTHMA

Step 1

Adults & Adolescents

NAEPP

- Preferred
 - prn SABA

GINA

- Preferred Controller
 - prn low-dose ICS/formoterol
- Other options
 - Low dose ICS whenever SABA taken
- Preferred Reliever
 - prn low-dose ICS/formoterol
 - Other option: prn SABA

GINA 2019/2020: Step 1

- For safety, GINA no longer recommends prn SABA alone
 - Does not protect from severe exacerbations.
 - Regular or frequent use of SABAs ↑ risk of exacerbations.
 - New controller options for adults & adolescent (Sx < 2x/month & no exacerbation risk factors)
 - prn low-dose ICS-formoterol*
 - **OR** IF NOT AVAILABLE, low-dose ICS taken whenever SABA is taken*
- *off-label, all evidence with budesonide/formoterol**

Step 2

Adults and Adolescents

NAEPP

- Preferred controller
 - Daily low dose ICS & prn SABA
 - prn concomitant ICS/SABA
- Other options
 - Daily LTRA & prn SABA
 - Cromolyn or nedocromil or theophylline & prn SABA
- Steps 2-4: consider immunotherapy when warranted

GINA

- Preferred controller
 - Daily low dose ICS
 - prn low dose ICS/formoterol
- Other options
 - Daily LTRA
 - Low dose ICS taken whenever SABA is taken

GINA 2019/2020: Step 2

- Two “preferred” controller options
 - Regular low-dose ICS
 - As-needed low-dose ICS – formoterol*
- Other controller options
 - Low-dose ICS taken whenever SABA taken*
(*off-label, as separate or combination inhalers)
 - Daily leukotriene receptor antagonist (LTRA)
(LESS EFFECTIVE FOR EXACERBATIONS)
- Preferred reliever – prn low dose ICS/formoterol*
- All steps: prn SABA is “Other reliever option”

Step 3

Adults & Adolescents

NAEPP

- Preferred controller
 - Daily AND prn low dose combination ICS/formoterol*
- Other options (& prn SABA)
 - Daily medium dose ICS Daily low dose ICS/LABA
 - Daily low dose ICS/LAMA
 - Daily low dose ICS/LTRA
 - Daily low dose ICS/theophylline

GINA

- Preferred controller
 - Daily low dose ICS/LABA AND prn low dose combination ICS/formoterol*
- Other options
 - Medium dose ICS
 - Low dose ICS/LTRA

GINA 2019/2020: Step 3

- Before step-up, check diagnosis, inhaler technique, adherence, & co-morbidity
- Preferred controller option
 - Low-dose ICS-LABA maintenance
- Other options
 - Medium-dose ICS
 - Low-dose ICS plus LTRA
 - For adults with rhinitis who are allergic to house dust mite, consider adding sublingual immunotherapy (SLIT), if $FEV_1 > 70\%$ predicted
- **Preferred reliever** – prn low dose ICS/formoterol*, for patients prescribed maintenance and reliever therapy

Step 4

Adults & Adolescents

NAEPP

- Preferred Controller
 - Daily and prn combination medium dose ICS/formoterol
- Other options (& prn SABA)
 - Medium dose ICS/LABA
 - Medium dose ICS/LAMA
 - Medium dose ICS/LTRA
 - Medium dose ICS/theophylline

GINA

- Preferred controller
 - Medium dose ICS/LABA
- Other options
 - High dose ICS with add-on:
 - Tiotropium
 - LTRA

GINA 2019/2020: Step 4

- Before step-up, check inhaler technique & adherence
- Preferred controller option
 - Medium-dose ICS-LABA maintenance
- Other options
 - High dose ICS
 - Add-on tiotropium by mist inhaler
 - Add-on LTRA
 - SLIT if house dust allergic, and if $FEV_1 > 70\%$
- **Preferred reliever** – prn low dose ICS/formoterol* for patients prescribed maintenance and reliever therapy

Step 5

Adults & Adolescents

NAEPP

- Preferred controller
 - Medium-high dose ICS/LABA/LAMA
- Alternate controller
 - Medium-high dose ICS/LABA
 - High dose ICS/LTRA
- Consider add-on therapy with biologics

GINA

- Preferred controller
 - High dose ICS/LABA
 - Phenotypic assessment
 - Add-on therapy
 - Tiotropium
 - Anti-IgE
 - Anti-IL5/5R
 - Anti-IL4R
- Alternate controller
 - Add low dose OCS
 - Consider side-effects

GINA 2019/2020: Step 5

- In patients with uncontrolled Sx &/or exacerbations despite Step 4,
 - High-dose ICS-LABA
 - assess for contributory factors, optimal treatment, & refer for expert asthma assessment, including severe asthma phenotype, & potential add-on Tx
- Potential add-on treatments
 - Tiotropium
 - Biologics (based on phenotype)
 - Anti-IgE (omalizumab), anti-IL5/5R (mepolizumab, reslizumab, benralizumab), anti IL4R (dupilumab)
- Other options: low-dose OCS (systemic side effects)
- **Preferred reliever** – prn low dose ICS/formoterol* for patients prescribed maintenance and reliever therapy

Low, medium and high ICS doses: adults/adolescents

Adults and adolescents (12 years and older)			
Inhaled corticosteroid	Total daily ICS dose (mcg)		
	Low	Medium	High
Beclometasone dipropionate (pMDI, standard particle, HFA)	200-500	>500-1000	>1000
Beclometasone dipropionate (pMDI, extrafine particle*, HFA)	100-200	>200-400	>400
Budesonide (DPI)	200-400	>400-800	>800
Ciclesonide (pMDI, extrafine particle*, HFA)	80-160	>160-320	>320
Fluticasone furoate (DPI)	100		200
Fluticasone propionate (DPI)	100-250	>250-500	>500
Fluticasone propionate (pMDI, standard particle, HFA)	100-250	>250-500	>500
Mometasone furoate (DPI)	200		400
Mometasone furoate (pMDI, standard particle, HFA)	200-400		>400

This is NOT a table of equivalence. These are suggested total daily doses for the 'low', 'medium' and 'high' dose treatment options with different ICS.

DPI: dry powder inhaler; HFA: hydrofluoroalkane propellant; pMDI: pressurized metered dose inhaler (non-CFC); * see product information

AGES 5-11 YEARS: STEPWISE APPROACH FOR MANAGEMENT OF ASTHMA

	Intermittent Asthma	Management of Persistent Asthma in Individuals Ages 5-11 Years				
Treatment	STEP 1	STEP 2	STEP 3	STEP 4	STEP 5	STEP 6
Preferred	PRN SABA	Daily low-dose ICS and PRN SABA	Daily and PRN combination low-dose ICS-formoterol▲	Daily and PRN combination medium-dose ICS-formoterol▲	Daily high-dose ICS-LABA and PRN SABA	Daily high-dose ICS-LABA + oral systemic corticosteroid and PRN SABA
Alternative		Daily LTRA,* or Cromolyn,* or Nedocromil,* or Theophylline,* and PRN SABA	Daily medium-dose ICS and PRN SABA or Daily low-dose ICS-LABA, or daily low-dose ICS + LTRA,* or daily low-dose ICS + Theophylline,* and PRN SABA	Daily medium-dose ICS-LABA and PRN SABA or Daily medium-dose ICS + LTRA* or daily medium-dose ICS + Theophylline,* and PRN SABA	Daily high-dose ICS + LTRA* or daily high-dose ICS + Theophylline,* and PRN SABA	Daily high-dose ICS + LTRA* + oral systemic corticosteroid or daily high-dose ICS + Theophylline* + oral systemic corticosteroid, and PRN SABA
		Steps 2-4: Conditionally recommend the use of subcutaneous immunotherapy as an adjunct treatment to standard pharmacotherapy in individuals ≥ 5 years of age whose asthma is controlled at the initiation, build up, and maintenance phases of immunotherapy▲			Consider Omalizumab**▲	

Assess Control

- First check adherence, inhaler technique, environmental factors,▲ and comorbid conditions.
- **Step up** if needed; reassess in 2-6 weeks
- **Step down** if possible (if asthma is well controlled for at least 3 consecutive months)

Consult with asthma specialist if Step 4 or higher is required. Consider consultation at Step 3.

Control assessment is a key element of asthma care. This involves both impairment and risk. Use of objective measures, self-reported control, and health care utilization are complementary and should be employed on an ongoing basis, depending on the individual's clinical situation.

NOTES FOR INDIVIDUALS AGES 5-11 YEARS DIAGRAM

Quick-relief medications	<ul style="list-style-type: none">• Use SABA as needed for symptoms. The intensity of treatment depends on severity of symptoms: up to 3 treatments at 20-minute intervals as needed.• In Steps 3 and 4, the preferred option includes the use of ICS-formoterol 1 to 2 puffs as needed up to a maximum total daily maintenance and rescue dose of 8 puffs (36 mcg).▲• Caution: Increasing use of SABA or use >2 days a week for symptom relief (not prevention of EIB) generally indicates inadequate control and may require a step up in treatment.
Each step: Assess environmental factors, provide patient education, and manage comorbidities ▲	<ul style="list-style-type: none">• In individuals with sensitization (or symptoms) related to exposure to pests¹: conditionally recommend integrated pest management as a single or multicomponent allergen-specific mitigation intervention.▲• In individuals with sensitization (or symptoms) related to exposure to identified indoor allergens, conditionally recommend a multi-component allergen-specific mitigation strategy.▲• In individuals with sensitization (or symptoms) related to exposure to dust mites, conditionally recommend impermeable pillow/mattress covers only as part of a multicomponent allergen-specific mitigation intervention, but not as a single component intervention.▲
Notes	<ul style="list-style-type: none">• The terms ICS-LABA and ICS-formoterol indicate combination therapy with both an ICS and a LABA, usually and preferably in a single inhaler.• Where formoterol is specified in the steps, it is because the evidence is based on studies specific to formoterol.• In individuals ages 5-11 years with persistent allergic asthma in which there is uncertainty in choosing, monitoring, or adjusting anti-inflammatory therapies based on history, clinical findings, and spirometry, FeNO measurement is conditionally recommended as part of an ongoing asthma monitoring and management strategy that includes frequent assessment.

GINA 2020: Children 6-11

Box 3-5B
Children 6-11 years

Personalized asthma management:
Assess, Adjust, Review response

Symptoms
Exacerbations
Side-effects
Lung function
Child and parent satisfaction

Confirmation of diagnosis if necessary
Symptom control & modifiable risk factors (including lung function)
Comorbidities
Inhaler technique & adherence
Child and parent goals

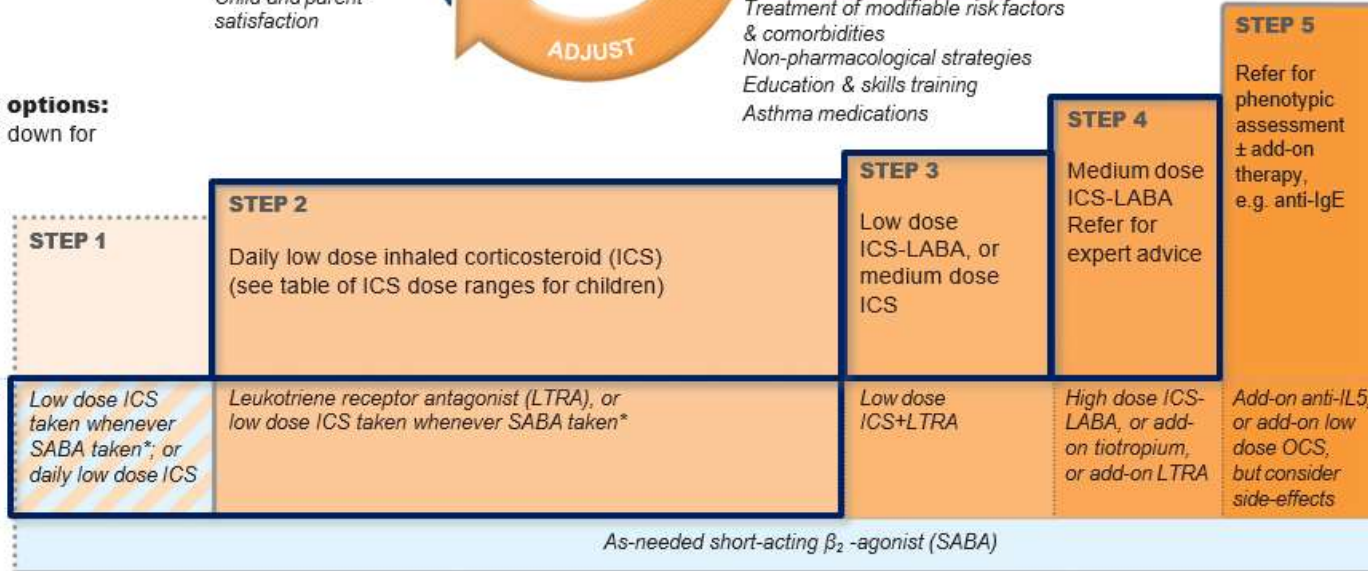

Treatment of modifiable risk factors & comorbidities
Non-pharmacological strategies
Education & skills training
Asthma medications

Asthma medication options:
Adjust treatment up and down for individual child's needs

PREFERRED CONTROLLER
to prevent exacerbations and control symptoms

Other controller options

RELIEVER

* Off-label; separate ICS and SABA inhalers; only one study in children

NAEPP/GINA: Step 1

Children 5 to 6-11 years

- Indication: symptoms < 2/month
- Preferred options
 - prn SABA (preferred reliever for all Steps)
- Other options
 - Low dose ICS taken whenever SABA used (consider likelihood of appropriate adherence)
 - Daily low dose ICS

NAEPP/GINA: Step 2

Children 5 to 6 – 11 years

- Indication: symptoms ≥ 2 /month, but $<$ daily
- Preferred options:
 - Low dose ICS and prn SABA
- Other options:
 - LTRA or theophylline and prn SABA
 - Low dose ICS concomitantly with prn SABA
 - Conditional recommendation of subQ immunotherapy
 - Studies of as-needed ICS-formoterol are needed; maintenance and reliever therapy with low dose budesonide-formoterol in children 4-11 years reduced exacerbations by 70-79% compared with ICS and ICS-LABA (*Bisgaard, Chest 2006*)

NAEPP/GINA: Step 3

Children 5 to 6 – 11 years

- Indication: symptoms most days, waking with asthma ≥ 1 /week
- Preferred options
 - Low dose ICS/LABA and prn SABA
 - Daily **and prn** low dose ICS/formoterol*
- Other options
 - Low dose ICS/LTRA or theophylline
 - Medium dose ICS
 - Conditional recommendation of subQ immunotherapy
 - No safety signal with ICS-LABA in children 4-11 years
(Stempel, NEJMed 2017)

NAEPP/GINA: Step 4

Children 5 to 6 – 11 years

- Indication: symptoms most days, waking with asthma ≥ 1 /week, and low lung function
- Preferred options:
 - Medium dose ICS/LABA, refer to specialist
 - Daily **and prn** medium dose ICS/formoterol*
- Other options:
 - Medium dose ICS/LTRA or theophylline
 - High dose ICS/LABA
 - Add-on tiotropium or add-on LTRA
 - Conditional recommendation of subQ immunotherapy
 - Short course OCS may be indicated

NAEPP/GINA: Step 5

Children 5 to 6 – 11 years

- Preferred options:
 - Continue Step 4 and refer for phenotypic assessment & add-on therapy (e.g. anti-IgE)
 - High dose ICS/LABA
- Other options:
 - High dose ICS/LTRA or theophylline
 - Add-on anti-IL5
 - Add-on low dose OCS (consider side effects)

NAEPP: Step 6

Children 5 – 11 years

- Preferred option:
 - High dose ICS/LABA & oral OCS
- Other options:
 - High dose ICS/LTRA or theophylline with OCS
 - Consider anti-IgE (omalizumab)

GINA 2020: Children 6-11

- Preferred reliever for all steps: prn SABA
- Step 1
 - Low dose ICS taken whenever SABA is taken (consider likelihood of good adherence)
 - Daily low dose ICS
- Step 2
 - Daily low dose ICS
 - Daily LTRA or low dose ICS taken whenever SABA is taken
 - Studies of as-needed ICS-formoterol are needed; maintenance and reliever therapy with low dose budesonide-formoterol in children 4-11 years reduced exacerbations by 70-79% compared with ICS and ICS-LABA (*Bisgaard, Chest 2006*)

Low, medium and high ICS doses: children 6-11 years

Children 6–11 years			
Inhaled corticosteroid	Total daily ICS dose (mcg)		
	Low	Medium	High
Beclometasone dipropionate (pMDI, standard particle, HFA)	100–200	>200–400	>400
Beclometasone dipropionate (pMDI, extrafine particle*, HFA)	50-100	>100-200	>200
Budesonide (DPI)	100–200	>200–400	>400
Budesonide (nebules)	250–500	>500–1000	>1000
Ciclesonide (pMDI, extrafine particle*, HFA)	80	>80-160	>160
Fluticasone furoate (DPI)	50		n.a.
Fluticasone propionate (DPI)	50-100	>100-200	>200
Fluticasone propionate (pMDI, standard particle, HFA)	50-100	>100-200	>200
Mometasone furoate (pMDI, standard particle, HFA)	100		200

This is NOT a table of equivalence. These are suggested total daily doses for the ‘low’, ‘medium’ and ‘high’ dose treatment options with different ICS.

DPI: dry powder inhaler; HFA: hydrofluoroalkane propellant; pMDI: pressurized metered dose inhaler (non-CFC); * see product information

NAEPP Expert Panel 2020

AGES 0-4 YEARS: STEPWISE APPROACH FOR MANAGEMENT OF ASTHMA

	Intermittent Asthma	Management of Persistent Asthma in Individuals Ages 0-4 Years				
Treatment	STEP 1	STEP 2	STEP 3	STEP 4	STEP 5	STEP 6
Preferred	PRN SABA and At the start of RTI: Add short course daily ICS [▲]	Daily low-dose ICS and PRN SABA	Daily low-dose ICS-LABA and PRN SABA [▲] or Daily low-dose ICS + montelukast,* or daily medium-dose ICS, and PRN SABA	Daily medium-dose ICS-LABA and PRN SABA	Daily high-dose ICS-LABA and PRN SABA	Daily high-dose ICS-LABA + oral systemic corticosteroid and PRN SABA
Alternative		Daily montelukast* or Cromolyn,* and PRN SABA		Daily medium-dose ICS + montelukast* and PRN SABA	Daily high-dose ICS + montelukast* and PRN SABA	Daily high-dose ICS + montelukast* + oral systemic corticosteroid and PRN SABA

For children age 4 years only, see Step 3 and Step 4 on Management of Persistent Asthma in Individuals Ages 5-11 Years diagram.

Assess Control

- First check adherence, inhaler technique, environmental factors,[▲] and comorbid conditions.
- **Step up** if needed; reassess in 4-6 weeks
- **Step down** if possible (if asthma is well controlled for at least 3 consecutive months)

Consult with asthma specialist if Step 3 or higher is required. Consider consultation at Step 2.

Control assessment is a key element of asthma care. This involves both impairment and risk. Use of objective measures, self-reported control, and health care utilization are complementary and should be employed on an ongoing basis, depending on the individual's clinical situation.

NOTES FOR INDIVIDUALS AGES 0-4 YEARS DIAGRAM

Quick-relief medications

- Use SABA as needed for symptoms. The intensity of treatment depends on severity of symptoms: up to 3 treatments at 20-minute intervals as needed.
- **Caution:** Increasing use of SABA or use >2 days a week for symptom relief (not prevention of EIB) generally indicates inadequate control and may require a step up in treatment.
- Consider short course of oral systemic corticosteroid if exacerbation is severe or individual has history of previous severe exacerbations.

Each step: Assess environmental factors, provide patient education, and manage comorbidities▲

- In individuals with sensitization (or symptoms) related to exposure to pests†: conditionally recommend integrated pest management as a single or multicomponent allergen-specific mitigation intervention.▲
- In individuals with sensitization (or symptoms) related to exposure to identified indoor allergens, conditionally recommend a multi-component allergen-specific mitigation strategy.▲
- In individuals with sensitization (or symptoms) related to exposure to dust mites, conditionally recommend impermeable pillow/mattress covers only as part of a multicomponent allergen-specific mitigation intervention, but not as a single component intervention.▲

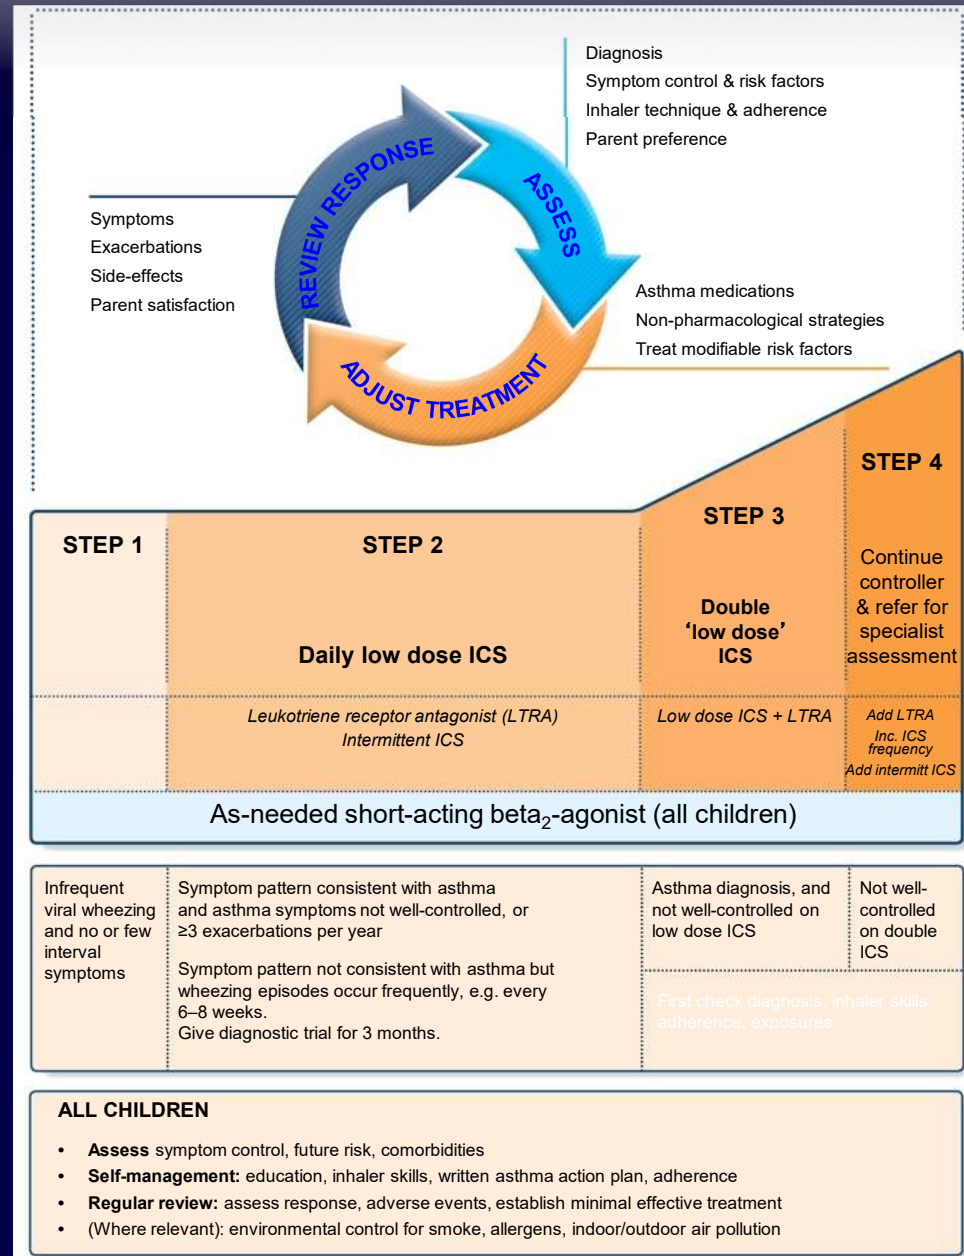

Notes

- If clear benefit is not observed within 4-6 weeks and the medication technique and adherence are satisfactory, the clinician should consider adjusting therapy or alternative diagnoses.

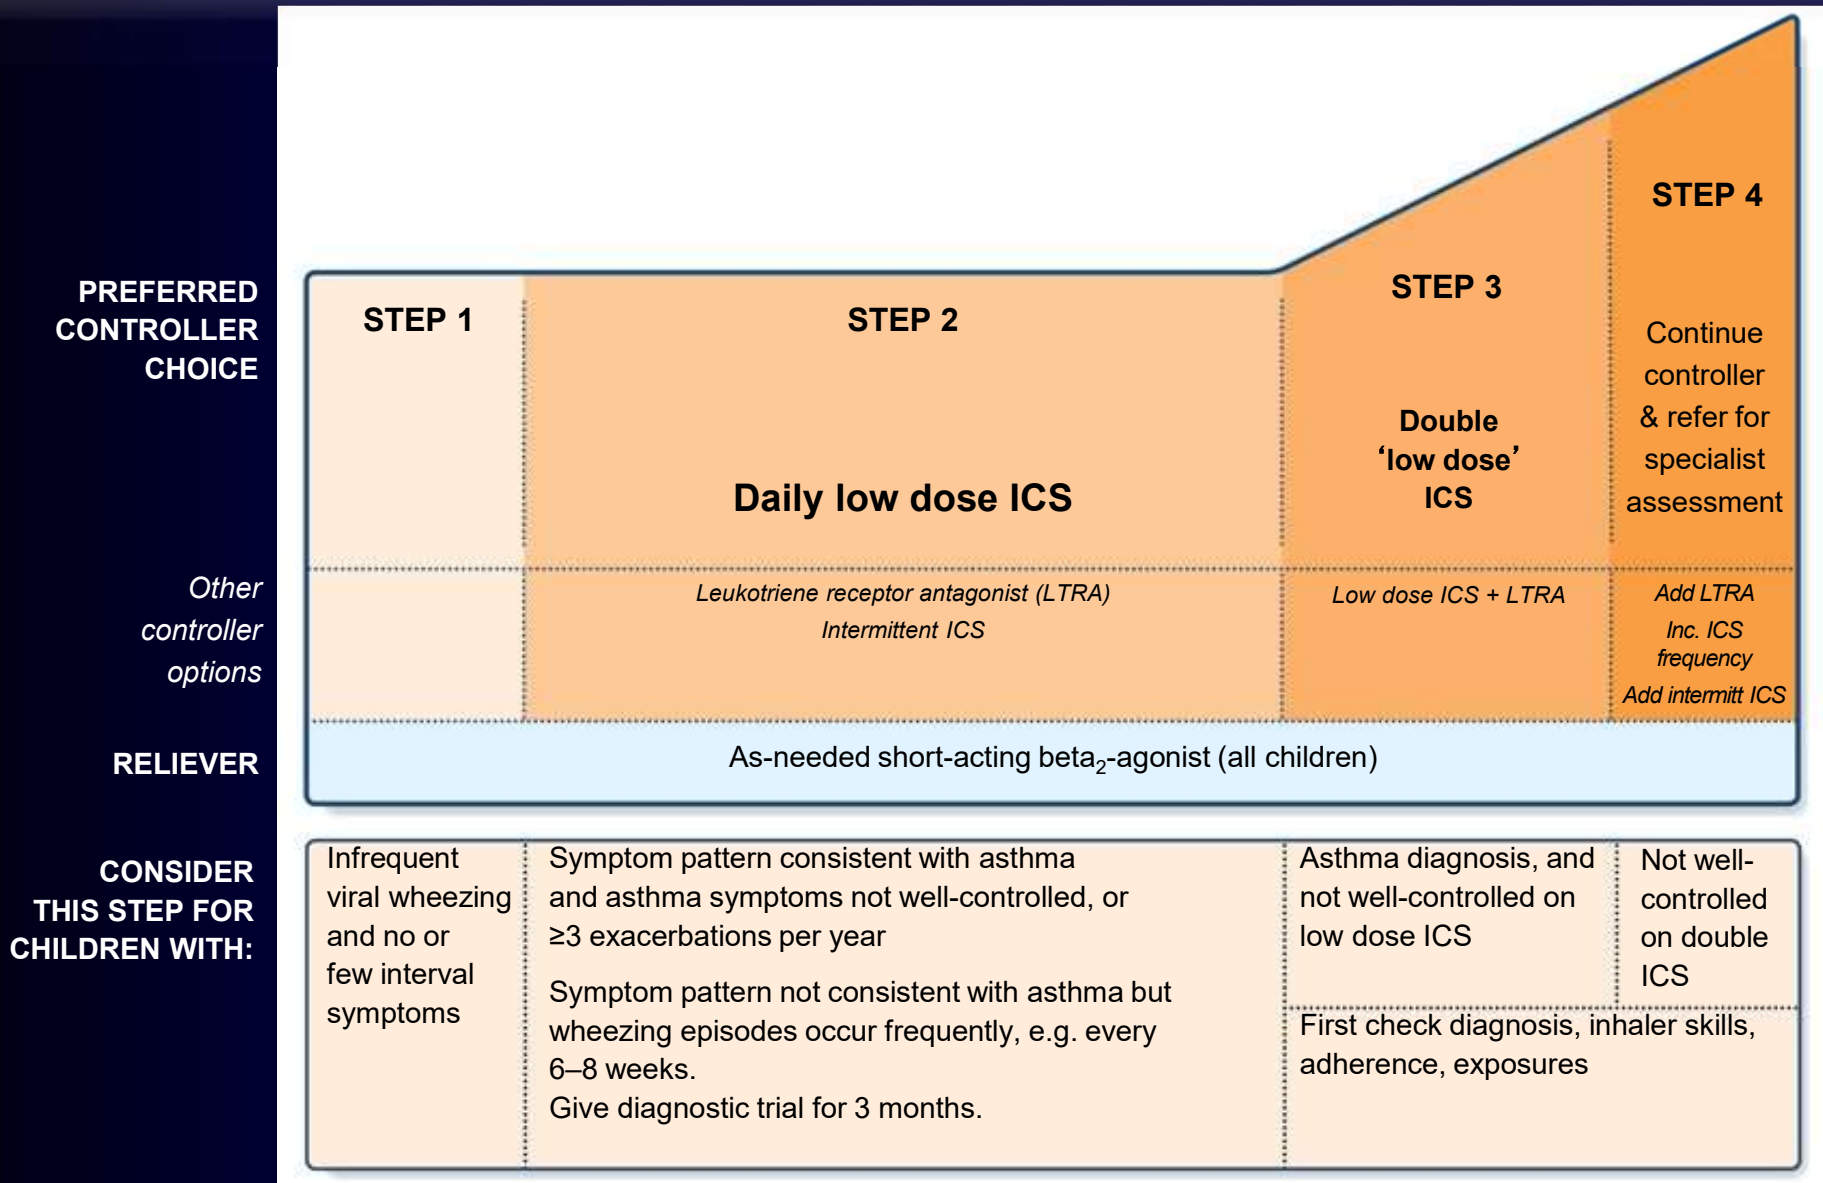

Intermittent ICS Recommendations

- Children ages 0-4
 - ≥ 3 wheezing episodes triggered by URI during lifetime OR ≥ 2 similar wheezing episodes in the past year AND asymptomatic between periods of URI
 - 7-10 day course of ICS with prn SABA starting at onset of signs/symptoms of URI

Stepwise approach to control symptoms and reduce risk (children ≤5 years)

Stepwise approach – pharmacotherapy (children ≤5 years)

Stepwise approach – key issues (children ≤ 5 years)

KEY ISSUES

ALL CHILDREN

- **Assess** symptom control, future risk, comorbidities
- **Self-management:** education, inhaler skills, written asthma action plan, adherence
- **Regular review:** assess response, adverse events, establish minimal effective treatment
- (Where relevant): environmental control for smoke, allergens, indoor/outdoor air pollution

- **Assess asthma control**
 - Symptom control, future risk, comorbidities
- **Self-management**
 - Education, inhaler skills, written asthma action plan, adherence
- **Regular review**
 - Assess response, adverse events, establish minimal effective treatment
 - Record height each year, as poorly-controlled asthma may influence growth, and ICS may be associated with growth delay in first 1-2 years
- **Other**
 - (Where relevant): environmental control for smoke, allergens, indoor or outdoor air pollution

NAEPP: Step 1

Children 0-4 years

- Preferred option: as-needed inhaled SABA
 - Provide inhaled SABA to all children who experience wheezing episodes
 - Add short course daily ICS at start of viral induced illness (consider likelihood of appropriate adherence)
- Other options
 - Oral bronchodilator therapy is not recommended (slower onset of action, more side-effects)

NAEPP/GINA: Step 2

Children 0-4 years

- Indication
 - Child with symptom pattern consistent with asthma, and symptoms not well-controlled, or ≥ 3 exacerbations per year
 - May also be used as a diagnostic trial for children with frequent wheezing episodes
- Preferred option: regular daily low dose ICS + as-needed inhaled SABA
 - Give for 4-6 weeks to establish effectiveness, and review response
- Other options depend on symptom pattern
 - (Persistent asthma) – regular leukotriene receptor antagonist (LTRA) leads to modest reduction in symptoms and need for OCS compared with placebo
 - (Frequent viral-induced wheeze with interval symptoms) – consider episodic or as-needed ICS, but give a trial of regular ICS first

NAEPP/GINA Step 3: Children 0-4 years

- Indication
 - Asthma diagnosis, and symptoms not well-controlled on low dose ICS
 - Evaluate diagnosis, adherence, inhaler technique and environmental exposures
- Preferred option:
 - Medium dose ICS and prn SABA
 - Low dose ICS/LABA and prn SABA
 - Reassess in 4-6 weeks
- Other options
 - Consider adding LTRA to low dose ICS

NAEPP/GINA: Step 4

Children 0-4 years

- Indication:
 - Not well controlled on Step 3 therapy
 - Evaluate diagnosis, adherence, inhaler technique, environmental exposures
- Preferred options:
 - Continue current controller & refer to specialist
 - Medium dose ICS/LABA and prn SABA
 - Reevaluate in 4-6 weeks
- Other options
 - Add LTRA, ↑ICS dose/frequency, add intermittent ICS
 - Medium dose ICS/LTRA and prn SABA
 - NAEPP: children age ≥ 4 years may use guidelines for ages 5-11

'Low dose' inhaled corticosteroids (mcg/day) for children ≤5 years

Inhaled corticosteroid	Low daily dose (mcg)
Beclometasone dipropionate (HFA)	100
Budesonide (pMDI + spacer)	200
Budesonide (nebulizer)	500
Fluticasone propionate (HFA)	100
Ciclesonide	160
Mometasone furoate	Not studied below age 4 years
Triamcinolone acetonide	Not studied in this age group

- This is not a table of equivalence
- A low daily dose is defined as the dose that has not been associated with clinically adverse effects in trials that included measures of safety

Checking height in children with asthma

NEW
2017

- Check height at least yearly, because:
 - Poorly-controlled asthma can affect growth [*Pedersen 2001*]
 - Growth velocity may be lower in the first 1-2 years of ICS treatment but this is not progressive or cumulative [*Kelly 2012, Loke 2015*].
 - The one study that examined long-term outcomes showed a difference of only 0.7% in adult height [*Kelly 2012, Loke 2015*]
- If decreased growth velocity is seen, also consider:
 - Poorly-controlled asthma
 - Frequent use of OCS
 - Poor nutrition

Inhaled corticosteroids and growth in children

- **Discuss decisions about controller treatment with parents/carers**
 - Discuss the relative benefits and risks of treatment/no treatment
 - Emphasize the importance of maintaining normal activity levels for normal physical and social development
- **ICS can have a small but usually temporary effect on growth**
 - An effect of ICS on growth velocity is seen in pre-pubertal children in the first 1-2 years of treatment
 - This is not progressive or cumulative *[Kelly 2012, Loke 2015]*.
 - The one study that examined long-term outcomes showed a difference of only 0.7% in adult height *[Kelly 2012, Loke 2015]*
- **Poorly-controlled asthma itself adversely affects adult height**
[Pedersen 2001]

Reviewing response and adjusting treatment

- How often should asthma be reviewed?
 - 1-3 months after treatment started, then every 3-12 months
 - During pregnancy, every 4-6 weeks
 - After an exacerbation, within 1 week
- Stepping up asthma treatment
 - *Sustained step-up*, for at least 2-3 months if asthma poorly controlled
 - Important: first check for common causes (symptoms not due to asthma, incorrect inhaler technique, poor adherence)
 - *Short-term step-up*, for 1-2 weeks, e.g. with viral infection or allergen
 - May be initiated by patient with written asthma action plan
 - *Day-to-day adjustment*
 - For patients prescribed low-dose ICS/formoterol maintenance and reliever regimen*
- Stepping down asthma treatment
 - Consider step-down after good control maintained for 3 months
 - Find each patient's minimum effective dose, that controls both symptoms and exacerbations

*Approved only for low dose beclometasone/formoterol and low dose budesonide/formoterol

General principles for stepping down controller treatment

- Aim
 - To find the lowest dose that controls symptoms and exacerbations, and minimizes the risk of side-effects
- When to consider stepping down
 - When symptoms have been well controlled and lung function stable for ≥ 3 months
 - No respiratory infection, patient not travelling, not pregnant
- Prepare for step-down
 - Record the level of symptom control and consider risk factors
 - Make sure the patient has a written asthma action plan
 - Book a follow-up visit in 1-3 months
- Step down through available formulations
 - Stepping down ICS doses by 25–50% at 3 month intervals is feasible and safe for most patients (*Hagan et al, Allergy 2014*)
 - See GINA 2017 report Box 3-7 for specific step-down options
- Stopping ICS is not recommended in adults with asthma because of risk of exacerbations (*Rank et al, JACI 2013*)

Preferred controller/reliever recommendations

	NAEPP 2020	GINA 2020
Step 1	Not reviewed	prn low-dose ICS/formoterol
Step 2	Daily low-dose ICS & prn SABA or prn low-dose ICS with SABA	Daily low-dose ICS & prn SABA or prn low-dose ICS/formoterol
Step 3	Daily low-dose ICS/formoterol (Maintenance & reliever therapy)	Daily low-dose ICS/LABA & prn SABA or Daily low-dose ICS/formoterol as maintenance & reliever therapy
Step 4	Daily medium-dose ICS/formoterol (Maintenance & reliever therapy)	Daily medium-dose ICS/formoterol & prn SABA or Daily medium-dose ICS/formoterol (Maintenance & reliever therapy)
Step 5	Daily medium-high dose ICS/LABA/LAMA& prn SABA	Daily high-dose ICS/LABA Phenotypic add on tx: tiotropium, biologics
Step 6	Not reviewed	Not applicable

Intermittent ICS

- Scheduled, daily ICS treatment is currently the preferred controller therapy for persistent asthma in individuals of all ages
- Intermittent = courses of ICS therapy used for brief periods (in response to symptoms or as add-on therapy)

Intermittent ICS Recommendations

- Individuals ≥ 12 years with mild persistent asthma, use either
 - Daily low-dose ICS and prn SABA
 - For patients who are under or over perceivers of their asthma symptoms
 - prn ICS with SABA used concomitantly
 - 2-4 puffs of SABA with low-dose ICS q4h prn
- Regular follow up recommended to determine appropriateness of regimen

Intermittent ICS Recommendations

- In individuals ≥ 4 years with moderate-severe persistent asthma, ICS-formoterol in a single inhaler may be used as both daily controller therapy and reliever therapy compared to daily high-dose ICS and prn SABA or daily ICS/LABA and prn SABA
 - Maximum daily formoterol dose
 - 36 mcg for ages 4-11
 - 54 mcg for ages ≥ 12 years

Intermittent ICS Recommendations

- In individuals ≥ 4 years with moderate-severe persistent asthma
 - May not be necessary for patients whose asthma is currently well controlled using alternate regimens
 - Appropriate for Step 3 & Step 4 treatment
 - This therapy should not be used in patients using ICS/salmeterol maintenance
 - Administer as ICS/formoterol maintenance as 1-2 puffs 1-2 times daily and 1-2 puffs prn

COVID-19 and asthma (as at April 3, 2020)

- Advise patients with asthma to continue taking their prescribed asthma medications, particularly *inhaled corticosteroids* (ICS), and oral corticosteroids (OCS) if prescribed
 - Asthma medications should be continued as usual. Stopping ICS often leads to potentially dangerous worsening of asthma
 - For patients with severe asthma: continue biologic therapy, and do not suddenly stop OCS if prescribed
- Make sure that all patients have a *written asthma action plan* with instructions about:
 - Increasing controller and reliever medication when asthma worsens
 - Taking a short course of OCS for severe asthma exacerbations
 - When to seek medical help
 - See the GINA 2020 report for more information about treatment options for asthma action plans.
- *Avoid nebulizers* where possible
 - Nebulizers increase the risk of disseminating virus to other patients AND to health care professionals
 - Pressurized metered dose inhaler via a spacer is the preferred treatment during severe exacerbations, with a mouthpiece or tightly fitting face mask if required

COVID-19 and asthma

(as at March 30, 2020)

- *Avoid spirometry* in patients with confirmed/suspected COVID-19
 - Spirometry can disseminate viral particles and expose staff and patients to risk of infection
 - While community transmission of the virus is occurring in your region, postpone spirometry and peak flow measurement within health care facilities unless there is an urgent need
 - Follow contact and droplet precautions
- *Follow strict infection control procedures* if aerosol-generating procedures are needed
 - For example: nebulization, oxygen therapy (including with nasal prongs), sputum induction, manual ventilation, non-invasive ventilation and intubation
 - World Health Organization (WHO) infection control recommendations are found here: [www.who.int/publications-detail/infection-prevention-and-control-during-health-care-when-novel-coronavirus-\(ncov\)-infection-is-suspected-20200125](http://www.who.int/publications-detail/infection-prevention-and-control-during-health-care-when-novel-coronavirus-(ncov)-infection-is-suspected-20200125)
- *Follow local health advice* about hygiene strategies and use of personal protective equipment, as new information becomes available in your country or region
