

ANTIDEPRESSANT ADVERSE EFFECTS

Casey Gallimore, PharmD, MS

Learning Objectives

- List common and serious adverse effects of individual antidepressant agents, and recognize characteristics that make patients more or less susceptible (i.e. anticholinergic effects in elderly patients).
- Predict onset and duration of adverse effects associated with antidepressants (i.e. What is time to onset for each adverse effect? If an adverse effect occurs, is it expected to be transient or chronic?)
- Provide recommendations to minimize or manage antidepressant adverse effects.

General Antidepressant Adverse Effects

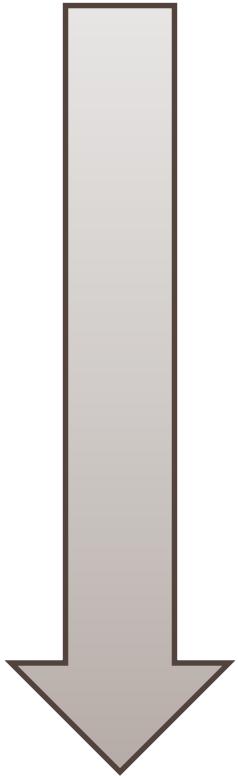

**63% of patients in trials experienced ≥ 1 adverse effect

Clinical Course		
Transient*	Chronic	Rare
GI effects (upset, N/V/C) Dizziness Headache Sedation / Insomnia Anxiety / jitteriness	Sweating Tremor Anticholinergic effects BP/HR changes Vivid dreams Weight changes Sexual side effects	Worsening mood / suicide Asthenia EPS (akathisia/dyskinesia) Bruxism QT prolongation Reduced seizure threshold Bone fracture? Serotonin syndrome Hyponatremia (SIADH)

*Transient: effect tends to be worst following initiation or dosage increases, often minimizes with time (1-4 weeks at consistent dose) or slower taper, but in some patients may not entirely go away

(SIADH) syndrome of inappropriate antidiuretic hormone (EPS) extrapyramidal symptoms

**MOST

Side Effect Management

Sexual Side Effects

~25-80% of patients taking antidepressants experience sexual side effects

- Low sexual desire or libido
 - Arousal difficulties (lubrication in women and erectile function in men)
 - Lack of orgasm
-
- Mesolimbic dopaminergic system involved in maintenance of sexual desire, arousal and orgasm
 - SSRIs and venlafaxine decrease dopaminergic transmission by acting as agonists at 5HT-2 receptors

Sexual Side Effect Management Options

- Drug holiday
- Dose reduction
- Psychological interventions
- Mechanical devices
- Switch antidepressant**
- Augmentation
 - Bupropion**
 - Mirtazapine
 - Sildenafil, tadalafil**
 - Granisetron
 - Ginkgo biloba
 - Buspirone
 - Olanzapine
 - Amantadine
 - Yohimbine
